

LSG has taken the next step in Boar Stud Biosecurity and Ultra Safe Genetic Transfer by installing a state of the art Air Filtration System into our Boar Stud facilities.

The Air Filtration System effectively filters the incoming air for potential pathogens and virus particles to protect the boars from diseases such as PRRS, Mycoplasma Hyopneumoniae (MYHO), Porcine Circo Virus Associative Disease (PCVAD), Actinobacillus pleuropneumoniae (APP) and many more.

To the best of our knowledge no boar stud in the world has broken with the PRRS virus that uses this system.

We take our Herd Health very seriously and aggressively protect it. One of the main focuses of our company is to deliver an Ultra High Health product and to explore all new technological advancements as they become available to protect our customer's herds.
